

---

**DESIGN SPECIFICS FOR THE BUTLER SEPTIC REPLACEMENT - 3 BR/C  
1922 SHERBORN - WPCLF GRANT (SPRINGFIELD TOWNSHIP – LUCAS COUNTY)**

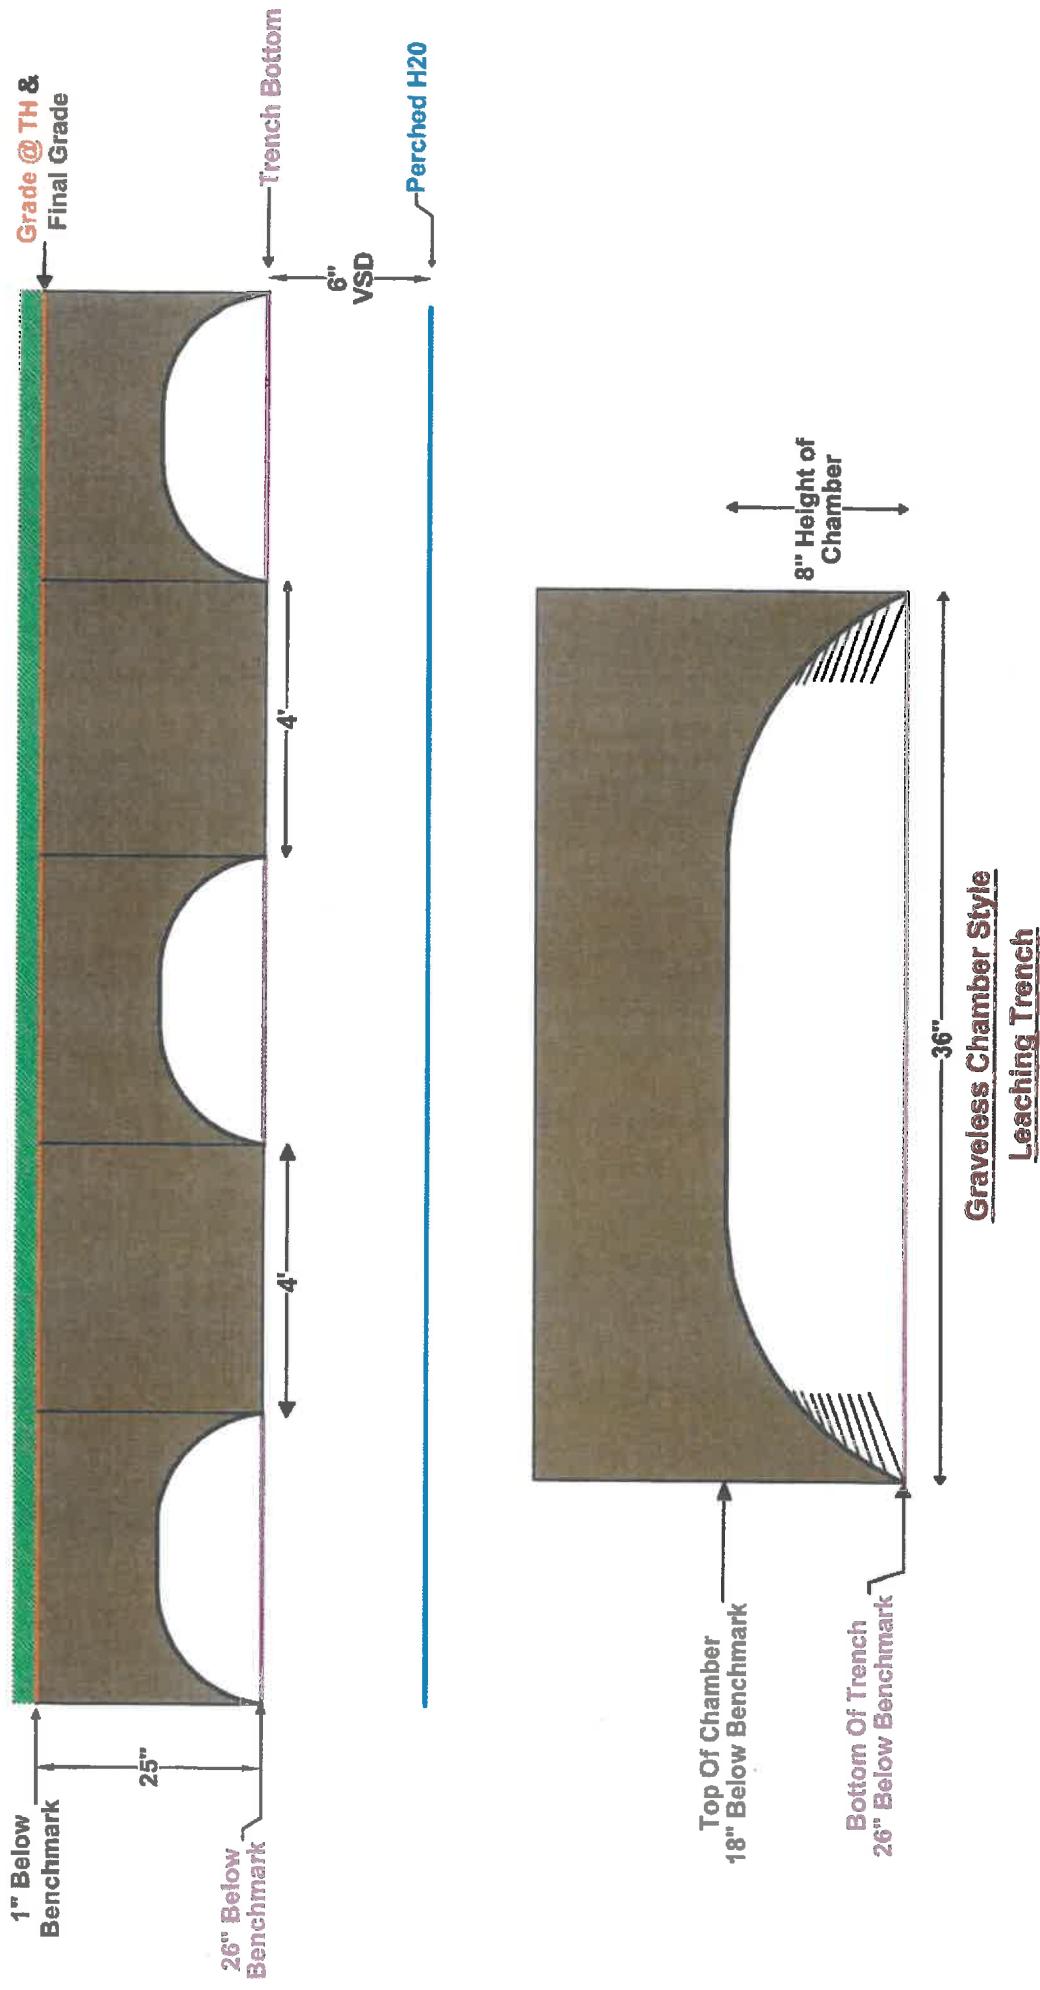

1. STS Rules 3701-29 of the OAC shall be followed. Call OUPS (#811) PRIOR TO installation of HSTS.
2. LHD, septic installer and/or designer must discuss any questions, changes or concerns prior to/during the installation of the system as needed.
3. Make sure that all clear water (sump, downspouts, etc.) is rerouted away from the main sewer line and that all gray water (sinks, laundry etc.) is rerouted into the main sanitary line *as needed*.
4. Line from the house to the new septic tank must be **SCH 40 or SDR 35** and must maintain 1/8" to 1/4" per foot. Install an exterior cleanout with slide on cover (not threaded). Bed line in firmly packed existing in-situ soil EXCEPT for the first three to four feet (3' - 4') next to the foundation of the home which must be bedded in leach field stone to prevent settling.
5. Install a new **1500-gallon septic tank** in a north to south direction as shown. Tank must be state approved with inlet and outlet risers that are flush with grade. Install tank with leach field stone on bottom of excavation and backfill with 411's/310's or in-situ soil except for areas under inlet and outlet pipes which will be bedded in leach field stone to prevent lines from settling. Install a 4" to 6" sanitary conversion tee on the tank **inlet** (cut 6" below the flow line IF baffle is not precast in the tank) and a 4" or 6" **outlet tee** (cut 18" below the flow line). Install a 4" OR 6" effluent filter on the outlet of the tank per 3701-29-12 (C) 3. *Due to extreme site limitations, new tank will be set in the same location as the existing tank.*
6. **Existing tank** must be, pumped and properly abandoned per state requirements and proper documentation submitted to the TLCHD.
7. Line from new tank to distribution box shall be 4" **SDR 35** maintaining a minimum fall of 1/2" – 1" per 10 foot of run length and must be bedded in 310's/411's or in-situ soil (**not** leach field stone).
8. Obtain a **distribution box** designed to handle the system design as shown (minimum of 3 outlets and 1 inlet line from tank). A cap or elbow is required to allow one "run"/ set of runs (72') of the system to "rest". Lines will exit the distribution box and feed each "run" independently. The lines exiting the **distribution box** must be **SDR 35** and shall be at the same elevation and bedded in in-situ soil (**not** leach field stone).
9. System design based on utilizing the **Infiltrator 36 Low Profile Chambers** (Trench width of 36"). Install three (3) runs at 72' in length per leaching trench design calculation. [NOTES: a) Two (2) sets of 36' runs and one set of three (3) 24' runs (72' total run length each) will be connected via a manifold exiting the distribution box as shown on the design proposal to allow for required resting of the trench length specified b) A variance will be needed from the local health department since the trenches cannot be installed at the required length of 72' along the length of contour although the required lineal and square footage will be maintained]. Place chamber four (4) feet between the leaching trenches walls [permitted per 34701-29-15 Appendix A III (E)].
10. Soil evaluation confirms that the chambers can be installed 25" into the in-situ soil while maintaining a VSD of 6" from the perched water table specified.
11. Maintain a minimum of 10' any area of the HSTS (including the tank) and house, all hardscapes (sidewalk, driveway etc.), property lines and road right of way/easements. Maintain 8' from any existing/proposed drain lines and 10' from the **city water line**.
12. **Bench Mark** is the red dot on the edge of the sidewalk on the north side of the house. Area of replacement leaching trenches (**test hole**) is 1" below the benchmark. No fill will be required prior to installation of the leaching trenches. The initial trench depth may vary slightly due to the uneven topography however the **bottom of each leaching trench** will maintain at least 6" from the perched water table (26" below the bench mark).
13. The **top of each chamber** will be 18" below the bench mark. The initial and **final grade** in the area of the leach field will be (+/-) 1" below the bench mark
14. Plant grass ASAP after system is backfilled.

## Septic Design Proposal

| Additional Area Required for Chamber System |  |  |
|---|--|--|
| 450 + 25% Reduction = 337.5 ft <sup>2</sup> |  |  |

| Minimum Absorption Area - 25% Reduction = New Min. Absorption Area for Chamber System |  |  |
|---|--|--|
| 450 - 25% Reduction = 337.5 ft <sup>2</sup>   |  |  |

| Number of Trenches to Maintain Total Absorption Area      |  |  |
|---|--|--|
| Trench Length X Trench Width = Absorption Area Per Trench |  |  |

| Trench Length X Trench Width = Absorption Area Per Trench |  |  |
|---|--|--|
| 90 X 3 = 270  |  |  |

| Total Absorption Area | | |
| --- | --- | --- |

## Arc 36 Low Profile Chamber

The Arc 36 Low Profile (LP) septic leaching chamber is a sturdy, lightweight plastic unit that combines maximized infiltrative surface area and storage capacity with an improved structural design to accommodate most conventional leachfield system challenges without sacrificing performance.
